# About This Guide

## Audience & Purpose

This document is intended as an introduction for end users to start evaluating Murata Wi-Fi/Bluetooth solutions for FreeRTOS on NXP i.MX platforms.

## **Document Conventions**

Table 1 describes the document conventions used in this guide.

Conventions	Description
	Warning Note Indicates very important note. Users are strongly recommended to review.
i	Info Note Intended for informational purposes. Users should review.
F.	Menu Reference Indicates menu navigation instructions. Example: Insert→Tables→Quick Tables→Save Selection to Gallery <b>F</b>
□7	External Hyperlink         This symbol indicates a hyperlink to an external document or website.         Example: Embedded Artists AB 다가         Click on the text to open the external link.
Ľ	Internal Hyperlink         This symbol indicates a hyperlink within the document.         Example:       Introduction ⊑ <sup>r</sup> Click on the text to open the link.
Console input/output or code snippet	Console I/O or Code Snippet This text Style denotes console input/output or a code snippet.
<pre># Console I/O comment // Code snippet comment</pre>	<ul> <li>Console I/O or Code Snippet Comment</li> <li>This text Style denotes a console input/output or code snippet comment.</li> <li>Console I/O comment (preceded by "#") is for informational purposes only and does not denote actual console input/output.</li> <li>Code Snippet comment (preceded by "//") may exist in the original code.</li> </ul>

#### **Table 1: Document Conventions**

## 1 Introduction

This Quick Start Guide details enabling a selection of NXP based Murata's Wi-Fi/Bluetooth modules on the NXP i.MX RT Evaluation Kits (running FreeRTOS). The Embedded Artists' M.2 modules in this document covers:

- Type 1XK (IW416)
- Type 1ZM (88W8987)
- Type 2DS (88W8801)

Murata supports several NXP i.MX RT EVKs and Wi-Fi/Bluetooth M.2 modules. This Quick Start documents only one hardware/software configuration to introduce users to the Murata solution. For more details on different configurations supported, please refer to the Murata Wi-Fi/BT (NXP) Solution for i.MX FreeRTOS User Guide <sup>L</sup>. Figure 1 below shows the setup used in this document – NXP i.MX RT1060 EVK with Type 1XK module (enabled by Murata's uSD-M.2 Adapter and Embedded Artists' 1XK M.2 module).

Figure 1: NXP i.MX RT1060 with Type 1XK (WLAN-only configuration)

The NXP □<sup>2</sup> and Embedded Artists □<sup>2</sup> platforms currently supported are based on i.MX RT microprocessors. Wireless connection is provided by either the Embedded Artists' Wi-Fi/BT M.2 EVBs directly, or by combining with Murata's uSD-M.2 Adapter □<sup>2</sup>.

The example setup used to illustrate the various steps is NXP i.MX RT1060 EVK I with Murata Type 1XK I module (Embedded Artists' M.2 module with uSD-M.2 Adapter interconnect), connected to a host PC running Windows®.

Wi-Fi/Bluetooth M.2 EVB (Evaluation Board) is equivalent to Wi-Fi/Bluetooth M.2 module. We use "EVB" sometimes to better distinguish the M.2 form factor from the actual Murata module.

The following parts are used in this quick start guide:

- NXP IMXRT1060-EVK
- Embedded Artists EAR00385
- Murata LBEE0ZZ1WE-uSD-M2 (LBEE0ZZ1WE-TEMP)

# 2 Example Setup

## 2.1 Hardware

**Figure 2** below provides a high-level overview of the hardware interconnect. Embedded Artists' 1XK M.2 module is connected to NXP's i.MX RT1060 EVK via Murata's uSD-M.2 Adapter. Note that this configuration only enables the Wi-Fi interface. For Bluetooth operation, additional connections using jumper cables must be made. For details, refer to the Murata User Guide  $\Box^{\mu}$ .

Figure 2: Connecting the Wi-Fi/BT M.2 module to the i.MX RT EVK

## NXP i.MX RT1060 EVK

## 2.2 Software

While multiple IDEs can be used to develop on the i.MX RT 1060 EVK, this example uses NXP's MCUXpresso IDE.

- 1. Download and install the following software.
  - MCUXpresso IDE (version 11.6.0) □
  - Mbed Virtual COM Port Driver 🗹 (The EVK must be plugged in before installing this)
  - A terminal application (Tera Term <sup>□</sup>, PuTTY <sup>□</sup>, etc.).
  - iPerf **□**

Refer to the NXP i.MX RT 1060 EVK getting started page

- Download the latest 2.11.0 SDK for i.MX RT1060 EVK using the MCUXpresso SDK Builder on NXP website.
  - Go to SDK Builder homepage □<sup>7</sup>.
  - Click on "Select Development Board" and sign in with your NXP login credentials.
  - On the "Select Development" page, enter "EVK-IMXRT1060" under "Search by Name". This will correctly highlight/select the i.MX RT1060 EVK we are using.
  - On the right side of the page, click on "Build MCUXpresso SDK v2.11.0".

- You will now transition to "Build SDK for EVK-IMXRT1060" page. Click the "Select All" button followed by the "Download SDK" button. Click on "I Agree" to the EULA.
- The i.MX RT1060 SDK is now being downloaded.
- Once downloaded, hit the "Close button" on pop-up window.
- Examine your "Downloads" folder directory it should now list "SDK\_2\_11\_0\_EVK-MIMXRT1060.zip".
- 3. Launch the installed MCUXpresso IDE 11.6 and select the IDE view.
- 4. Open "Installed SDKs" tab (bottom middle of IDE). Drag and drop the new SDK file into this region. You should then see the SDK zip file being copied over and appear on the "Installed SDK" list.

## 3 Import Example

Various sample applications are provided by the SDK. The wifi\_iperf example, which is a performance test for the 1XK module, will be used in this document.

- 1. Click on Import SDK example(s)... in the "Quickstart" Panel, as shown in Figure 3.
- 2. Select evkmimxrt1060 board and click the Next button, as shown in Figure 4.
- 3. Expand **wifi\_examples** and select **wifi\_iperf**. Click **Finish**. Ensure SDK Debug Console is set as **UART** in Project Options. See **Figure 5** for reference.
- Open evkmimxrt1060\_wifi\_iperf/source/app\_config.h file and change the enabled compiler flag as per the module name. In this example (using Murata 1XK module), the WIFI\_IW416\_BOARD\_MURATA\_1XK\_USD flag needs to be set. See Figure 6 for reference.

It is possible to build the example for modules 2DS and 1ZM as well using the same files. Just replace the compiler flag WIFI\_IW416\_BOARD\_MURATA\_1XK\_USD in file source/app\_config.h to WIFI\_88W8801\_BOARD\_MURATA\_2DS\_USD or WIFI\_88W8987\_BOARD\_MURATA\_1ZM\_USD respectively.

- Optionally, change the country/region specific TX power setting by editing the same file source/app\_config.h and enabling the required header file under the WIFI\_IW416\_BOARD\_MURATA\_1XK\_USD compiler flag), as shown in Figure 7.
- Open evkmimxrt1060\_wifi\_iperf/source/main.c file and modify the EXT\_AP\_SSID, EXT\_AP\_PASSPHRASE and IPERF\_SERVER\_ADDRESS macros as per your setup. See Figure 8 for reference.
- 7. Save the changes.

## 4 Build and Run

The steps to build and run the example are given below.

- By default, debug mode is selected for build. While the example will work correctly in debug mode, for better performance, it is suggested to build in release mode. To select release mode build, right-click on the example and select Build Configurations → Set Active → Release (Release build) See Figure 9 for reference.
- 2. Click Debug in the QuickStart Panel as shown in **Figure 10**. This will start the build and once completed start the deployment automatically.
- 3. A probe selection window may show, if this is the first time this example is being run. Select the correct probe (there should only be one if just one EVK is connected) and click **OK** as shown in **Figure 11**.
- Once the build completes, open the terminal application (e.g., Tera Term) on the appropriate COM port (you can check the port number in Windows Device Manager, under **Ports (COM & LPT)**). Configure port for 115200 bps, 8 bits data, no parity, and 1 stop bit (115200/8/N/1).
- 5. Click resume button in MCUXpresso as shown in Figure 12.
- 6. You should see output as shown in Figure 13 on the terminal.
- 7. Enter mode 'c' to run to connect to the AP. See Figure 14 for reference.
- 8. Connect the host PC to the same Wi-Fi network as the EVK (**nxp\_wifi\_demo** in this example).
- 9. Run iPerf on the host PC in server mode.

iperf -s -i 1

10. On the EVK terminal, enter mode number '4' to select TCP client tradeoff mode (TX and RX sequentially). The test will start. A 10 second TX test will be followed by a 10 second TX test and the results will be printed as shown in **Figure 15**.
