

5 Example of Noise Suppression in DVD Players

Noise Emission Status :

Noise generated in the DVD player is radiated from the audio and video signal cables. In addition, although the player body is shielded with a metal case, radiated noise is emitted from the connector port openings.

A DVD player processes image signals using the MPEG2 method. Since image Processing requires high-speed signal processing, signals are transmitted at a very high speed. Therefore, high frequency noise around 1GHz, may be radiated.
