

Communication Protocol Support

The D1U family of power supplies currently supports 3.3V-bus and 5V-bus standard-mode (100kHz) I²C Serial Communication as outlined in Philips Semiconductors “The I²C Bus Specification Version 2.1” (January 2000).

The D1U family of power supplies can also support 3.3V-bus and 5V-bus SMBUS Serial Communication as outlined in the SBS Implementers forum “System Management Bus (SMBUS) Specification Version 2.0” (August 2000)

D1U power supplies are configured to operate as slave-only devices.

However, they can be re-configured to support single master operation and multi-master and slave operation.

The available address lines currently allows for communication with up to 8 D1U power supplies on a single serial communication bus.

Each D1U power supply contains a:

1. 2K serial EEPROM device used for FRU data storage (FRU data specs customer specific)
2. System-On-Chip (SOC) -type controller used for D1U status, fault, and parametric data reporting and remote on/off control

Serial Comm. Device Addressing

The D1U family of power supplies supports 8-bit addressing (7-bit slave address & LSB read/write bit).

The specified addressing is as follows:

Address Byte							
7	6	5	4	3	2	1	0
1	0	0	0	A2	A1	A0	R/W
MSB				LSB			

Address lines A0 (LSB), A1, & A2 are internally connected to the standby bus (backplane) voltage through 7.5K pull-up resistors.

The address lines are pin-strapped (grounded or left open) on the backplane connectors to determine the unique 7-bit slave address assigned to each D1U slot in the backplane.

Serial Comm. Read/Write Registers

On a host read request, the D1U power supplies transmits up to 6 8-bit registers that provide power supply status info, o/p fault indicators, and parametric data.

The 6 data registers are ordered as follows:

- Byte 0: Status - Power supply operation status
- Byte 1: O/P Fault - Main output fault, standby output fault, & fan fail fault status
- Byte 2: Main output voltage - 8-bit scaled representation of Main output voltage
- Byte 3: Main output current - 8-bit scaled representation of Main output current
- Byte 4: Fan 1 current - 8-bit scaled representation of Fan1 current
- Byte 4: Fan 2 current - 8-bit scaled representation of Fan2 current

On a host write request, the D1U power supply can receive a single byte command to enable/disable the main output through serial communication.

The 1 command register is as follows:

- Byte 0: On/Off - Main output on/off control

Status/Fault Registers

Byte 0 - The D1U Status register function and definitions are as follows:

BYTE 0 - Status Register							
7	6	5	4	3	2	1	0
PS_ON	P_GOOD	AC_OK	PS_BAD	Fan Failure	OT Warning	OT Critical	AC RANGE
MSB				LSB			

Bit #	Bit Status Description	
	Set	Clear
7	Main Output Enabled	Main Output Disabled
6	Main Output Within Regulation	Main Output Out Of Regulation
5	AC Input Voltage OK	AC Input Voltage Out Of Range Unit
4	PS Fault Detected	PS OK
3	Fan1/Fan1 Fault Detected	Fan1/Fan2 OK
2	PS Temperature Warning	PS Within Normal Temp
1	PS Shutdown Due To Overtemp	No Over Temp Shutdown
0	AC Input High Range Detected	AC Input Low Range Detected

Byte 1 - The D1U O/P Fault register function and definitions are as follows:

BYTE 0 - Status Register							
7	6	5	4	3	2	1	0
12 OV	12 UV	12V OC	STBY FAIL	FAN1 OC	FAN2 OC	-	-
MSB				LSB			

Bit #	Bit Status Description	
	Set	Clear
7	Main Output Overvoltage Fault	No OV Fault
6	Main Output Undervoltage Fault	No UV Fault
5	Main Output Overcurrent Fault	No OC Fault
4	Standby Output Fail Detect	Standby Output OK
3	Fan 1 Stall/Overcurrent Detect	Fan 1 OK
2	Fan 2 Stall/Overcurrent Detect	Fan 2 OK
1	-	-
0	-	-

Parametric Data Registers

The D1U family currently supports 8-bit monitoring of the main output voltage, main output current, and both fan filtered currents.

Note: Higher precision (10-bit or 12-bit) and accuracy monitoring of the same parameters can be supported with drop-in replacement on board SOCs with increased ADC capability but identical pin and function assignment.

Byte 2 - 8-bit representation of the Main Output Voltage

Model	Detection Range	Transfer Equation	Accuracy
D1U-W-1600-12-HC2C	0 Vdc to OVP	$V_{12V} = V_{12V} \text{ (8-bit dec) } \times (0.0555 \text{ V/LSB})$	±3% inside O/P regulation limits (0°-50°C)
D1U-W-1600-12-HA2C	0 Vdc to OVP	$V_{12V} = V_{12V} \text{ (8-bit dec) } \times (0.0555 \text{ V/LSB})$	±3% inside O/P regulation limits (0°-50°C)
D1U-W-1200-12-HC2C	0 Vdc to OVP	$V_{12V} = V_{12V} \text{ (8-bit dec) } \times (0.0555 \text{ V/LSB})$	±3% inside O/P regulation limits (0°-50°C)
D1U-W-1200-12-HA2C	0 Vdc to OVP	$V_{12V} = V_{12V} \text{ (8-bit dec) } \times (0.0555 \text{ V/LSB})$	±3% inside O/P regulation limits (0°-50°C)

On/Off Control Register

The D1U family currently supports a single write command byte to enable/disable the main 12V via serial communication as an alternate to external pin on/off toggling.

Note: The serial On/Off command can only toggle the main output on and off only if the PS_ON external pin is not externally shorted to GND (i.e. external pin is left open and not shorted to ground to enable the unit).

The On/Off command will not perform any function if the unit is already enabled via shorting the PS_ON external pin.

	Byte 173	0	NULL	FRU-Specific Information	

Address	Byte	HEX Data	ASCII	Description	Notes
	Byte 174	0	NULL	FRU-Specific Information	
	Byte 175	0	NULL	FRU-Specific Information	
[00B0]	Byte 176	0	NULL	FRU-Specific Information	
	Byte 177	0	NULL	FRU-Specific Information	
	Byte 178	0	NULL	FRU-Specific Information	
	Byte 179	0	NULL	FRU-Specific Information	
	Byte 180	0	NULL	FRU-Specific Information	
	Byte 181	0	NULL	FRU-Specific Information	
	Byte 182	0	NULL	FRU-Specific Information	
	Byte 183	0	NULL	FRU-Specific Information	
	Byte 184	0	NULL	FRU-Specific Information	
	Byte 185	0	NULL	FRU-Specific Information	
	Byte 186	0	NULL	FRU-Specific Information	
	Byte 187	C1		C1h indicates no more fields	
	Byte 188	0	NULL	Pad With Zeros	
	Byte 189	0	NULL	Pad With Zeros	
	Byte 190	0	NULL	Pad With Zeros	
	Byte 191	0F		Board Info Checksum	
	Byte 192	0	NULL	Power Supply Information Record	Start of Check-sum for multi-record
	Byte 193	2		End of list/version	
	Byte 194	18		Record length	
	Byte 195	B1		Record Checksum	
	Byte 196	35		Header Checksum	
	Byte 197	40		Overall capacity	(watts) (LSB)
	Byte 198	6		Overall capacity	(watts) (MSB)
	Byte 199	FF		Peak VA LSB	
	Byte 200	FF		Peak VA	
	Byte 201	FF		Inrush current	
	Byte 202	0		Inrush interval in ms.	
	Byte 203	28		Low end Input voltage range 1 (10mv) LSB	
	Byte 204	23		Low end Input voltage range 1 (10mv) MSB	
	Byte 205	B0		High end Input voltage range 1 (10mv) LSB	
	Byte 206	36		High end Input voltage range 1 (10mv) MSB	
	Byte 207	50		Low end Input voltage range 2 (10mv) LSB	

Address	Byte	HEX Data	ASCII	Description	Notes	
[00D0]	Byte 208	46		Low end Input voltage range 2 (10mv) MSB		
	Byte 209	20		High end Input voltage range 2 (10mv) LSB		
	Byte 210	67		High end Input voltage range 2 (10mv) MSB		
	Byte 211	2F		Low end Input frequency range		
	Byte 212	3F		High end Input frequency range		
	Byte 213	14		AC Dropout Tolerance (ms)		
	Byte 214	7		Binary Flags		
	Byte 215	0		Peak Wattage		
	Byte 216	0		Peak Wattage LSB		
	Byte 217	3		Combined Voltage Wattage ID		
	Byte 218	40		Combined Wattage LSB		
	Byte 219	6		Combined Wattage MSB		
	Byte 220	0		Predictive fail tachometer lower threshold		
	Byte 221	FF				
	Byte 222	FF				
	Byte 223	FF				
	[00E0]	Byte 224	FF			
		Byte 225	FF			
		Byte 226	FF			
		Byte 227	FF			
Byte 228		FF				
Byte 229		FF				
Byte 230		FF				
Byte 231		FF				
Byte 232		FF				
Byte 233		FF				
Byte 234		FF				
Byte 235		FF				
Byte 236		FF				
Byte 237		FF				
Byte 238		FF				
Byte 239		FF				
[00F0]		Byte 240	FF			
	Byte 241	FF				
	Byte 242	FF				
	Byte 243	FF				
	Byte 244	FF				

Address	Byte	HEX Data	ASCII	Description	Notes
	Byte 245	FF			
	Byte 246	FF			
	Byte 247	FF			
	Byte 248	FF			
	Byte 249	FF			
	Byte 250	FF			
	Byte 251	FF			
	Byte 252	FF			
	Byte 253	FF			
	Byte 254	FF			
	Byte 255	FF
