Abstract
This document provides a detailed application description of each PMBus™ command supported by Murata digital power modules based on PMBus™ specifications. Each command item includes command type, data length, data format, data range, data unit, default value, command definition and register data table. Besides, to get better understanding of data conversion, calculation examples are listed.

Introduction
The Murata digital power modules are designed to be PMBus™ revision 1.2 compliant. Digital PMBus™ interface allows the module to be configured, and communicate with system controllers. The following PMBus™ commands listed are relevant to DC/DC products and will vary with different module types. More Detailed PMBus™ information can refer to "PMBus™ Power System Management Protocol Specification, Part I – General Requirements, Transport and Electrical Interface" and "PMBus™ Power System Management Protocol, Part II – Command Language", available at http://pmbus.org.

2. Commands application

OPERATION (01h)

Type: Read Byte/Write Byte
Write Protectable

Data Number in Bytes: 1
Data Format: Bit field
Default Value: N/A
Units: N/A
Reference: Section 12.1 – PMBus™ Spec Part II

Definition: The OPERATION command is used, in conjunction with the hardwired CTRL pin, to turn the regulator output on and off. It also can be used to set the margin state (margin high, margin low, no margin) of the output voltage.

Data Content:

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

1. For some product, soft off function is not suitable and will cause overvoltage of MOSFET. So it is modified as immediate off.
2. 100101XXb, Unit on with Margin Low (Ignore Fault) is not supported for safety, and act as 100110XXb.
3. 101001XXb, Unit on with Margin High (Ignore Fault) is not supported for safety, and act as 101010XXb.
ON_OFF_CONFIG (02h)

Type: Read Byte/Write Byte
Write Protectable

Data Number in Bytes: 1
Data Format: Bit field
Default Value: 0x19
Units: N/A

Reference:
Section 12.2 – PMBus™ Spec Part II

Definition: The ON_OFF_CONFIG command configures the combination setting of both secondary side CONTROL pin input and commands received via the serial bus, to turn the unit on and off. This includes how the unit responds when power is applied. For products with Primary side ENABLE pin, its input logic also needs to be met at the same time.

Data Content:

<table>
<thead>
<tr>
<th>Data</th>
<th>Function</th>
<th>Bit Value</th>
<th>Description</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits [7:5]</td>
<td>Reserved</td>
<td>000</td>
<td>Unit powers up regardless state of CONTROL pin</td>
<td>000</td>
</tr>
<tr>
<td>Bit [4]</td>
<td>Sets the default to either operate any time power is present or for the on/off to be controlled by CONTROL pin and serial bus commands</td>
<td>0</td>
<td>Unit powers up regardless state of CONTROL pin</td>
<td>0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1</td>
<td>Unit does not power up until commanded by the CONTROL pin and OPERATION command (as programmed in bits [3:0]).</td>
<td>1</td>
</tr>
<tr>
<td>Bit [3]</td>
<td>Controls how the unit responds to commands</td>
<td>0</td>
<td>To start, the unit requires that the on/off portion of the OPERATION command is instructing the unit to run. Depending on bit [2], the unit may also require the CONTROL pin to be asserted for the unit to start and energize the output.</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1</td>
<td>Unit ignores the on/off portion of the OPERATION command</td>
<td>1</td>
</tr>
<tr>
<td>Bit [2]</td>
<td>Controls how the unit responds to the CONTROL pin</td>
<td>0</td>
<td>Unit ignores the CONTROL pin (on/off controlled only the OPERATION command)</td>
<td>0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1</td>
<td>Unit requires the CONTROL pin to be asserted to start the unit. Depending on bit [3], the OPERATION command may also be required to instruct the device to start before the output is energized.</td>
<td>1</td>
</tr>
<tr>
<td>Bit [1]</td>
<td>Polarity of the CONTROL pin</td>
<td>0</td>
<td>Pull pin low to make the unit on</td>
<td>0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1</td>
<td>Pull pin high to make the unit on</td>
<td>1</td>
</tr>
<tr>
<td>Bit [0]</td>
<td>CONTROL pin action when commanding the unit to turn off</td>
<td>0</td>
<td>Use the soft off (1)</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1</td>
<td>Turn off the output immediately.</td>
<td>1</td>
</tr>
</tbody>
</table>

1. For some product, soft off function will cause overvoltage of MOSFET and be modified as off immediately.

CLEAR_FAULTS (03h)

Type: Send Byte
Write Protectable

Data Number in Bytes: 0
Data Format: N/A
Default Value: N/A
Units: N/A

Reference:
Section 15.1 – PMBus™ Spec Part II

Definition: The CLEAR_FAULTS command is used to clear any fault bits that have been set. This command clears all bits in all status registers simultaneously.
WRITE_PROTECT (10h)
Type: Read Byte/Write Byte
Data Number in Bytes: 1
Data Format: Bit field
Default Value: 0x00
Units: N/A
Reference:
   Section 11.1 – PMBus™ Spec Part II
Definition: The WRITE_PROTECT command is used to control writing to the PMBus™ device to provide protection against accidental changes. All supported read commands can read out their parameters directly, regardless of the WRITE_PROTECT settings.
Data Content:

<table>
<thead>
<tr>
<th>Data</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x80</td>
<td>Disable all writes except to the WRITE_PROTECT command.</td>
</tr>
<tr>
<td>0x40</td>
<td>Disable all writes except to the WRITE_PROTECT and OPERATION commands.</td>
</tr>
<tr>
<td>0x20</td>
<td>Disable all writes except to the WRITE_PROTECT, OPERATION, ON_OFF_CONFIG and VOUT_COMMAND commands.</td>
</tr>
<tr>
<td>0x00</td>
<td>Enable writes to all commands.</td>
</tr>
</tbody>
</table>

STORE_DEFAULT_ALL (11h)
Type: Send Byte
Data Number in Bytes: 0
Data Format: N/A
Default Value: N/A
Units: N/A
Reference:
   Section 11.2 – PMBus™ Spec Part II
Definition: The STORE_DEFAULT_ALL command is used to store DEFAULT level operating parameters from RAM to data flash. After write operations, parameters are only kept in RAM and not in data flash, also not active (not in operation RAM). To void parameters lose when power off, need to use STORE_DEFAULT_ALL command to store in data flash after all write operations. Then the parameters in data flash will be active to operation RAM by restarting module, or using RESTORE_DEFAULT_ALL command right now. Note that any subsequent commands sent should be sent after a 250ms delay. Some products will automatically shut down for protection after STORE_DEFAULT_ALL command operation, and recover with stored parameters.

RESTORE_DEFAULT_ALL (12h)
Type: Send Byte
Data Number in Bytes: 0
Data Format: N/A
Default Value: N/A
Units: N/A
Reference:
   Section 11.3 – PMBus™ Spec Part II
Definition: The RESTORE_DEFAULT_ALL command is used to store DEFAULT level operating parameters from data flash to operation RAM. After STORE_DEFAULT_ALL command, parameters are only kept in data flash and not active (not in operation RAM). To active new parameters stored to operation RAM, need to use RESTORE_DEFAULT_ALL command after STORE_DEFAULT_ALL command. RESTORE_DEFAULT_ALL command is also automatically performed at power up. Note that any subsequent commands sent should be sent after a 20ms delay.
STORE_USER_ALL (15h)
Type: Send Byte
Write Protectable
Data Number in Bytes: 0
Data Format: N/A
Default Value: N/A
Units: N/A
Reference:
Section 11.6 – PMBus™ Spec Part II
Definition: The STORE_USER_ALL command is used to store USER level operating parameters from RAM to data flash. After write operations, parameters are only kept in RAM and not in data flash, also not active (not in operation RAM). To void parameters lose when power off, need to use STORE_USER_ALL command to store in data flash after all write operations. Then the parameters in data flash will be active to operation RAM by restarting module, or using RESTORE_USER_ALL command right now. Note that any subsequent commands sent should be sent after a 250ms delay. Some products will automatically shut down for protection after STORE_USER_ALL command operation, and recover with stored parameters.

RESTORE_USER_ALL (16h)
Type: Send Byte
Write Protectable
Data Number in Bytes: 0
Data Format: N/A
Default Value: N/A
Units: N/A
Reference:
Section 11.7 – PMBus™ Spec Part II
Definition: The RESTORE_USER_ALL command is used to store USER level operating parameters from data flash to operation RAM. After STORE_USER_ALL command, parameters are only kept in data flash and not active (not in operation RAM). To active new parameters stored to operation RAM, need to use RESTORE_USER_ALL command after STORE_USER_ALL command. RESTORE_USER_ALL command is also automatically performed at power up. Note that any subsequent commands sent should be sent after a 20ms delay.

CAPABILITY (19h)
Type: Read Byte
Data Number in Bytes: 1
Data Format: Bit field
Default Value: 0xB0
Units: N/A
Reference:
Section 11.12 – PMBus™ Spec Part II
Definition: The CAPABILITY command is used for a host system to read and determine some key capabilities of a PMBus™ device.

**VOUT_MODE (20h)**

**Type:** Read Byte  
**Data Number in Bytes:** 1  
**Data Format:** Mode + Exponent  
**Default Value:** 0x17 (Linear Mode, Exponent = -9)  
**Units:** N/A  
**Reference:**  
Section 8.2 – PMBus™ Spec Part II  
**Definition:** The VOUT_MODE command is one byte that consists of a three bit Mode, and a five bit Parameter to predefine the data format of the output voltage related commands (example: VOUT_COMMAND). The three bit Mode 000b sets the device use the linear modes for output voltage related commands. The five bit Parameter provides Exponent value for Linear Mode.  
**Data Content:**

<table>
<thead>
<tr>

| Bits [4:0] | Exponent parameter for output voltage related commands. | 10111 | Exponent for Linear mode data bytes is “-9”. | 10111 |

**VOUT_COMMAND (21h)**

**Type:** Read Word/Write Word  
**Write Protectable:**  
**Data Number in Bytes:** 2  
**Data Format:** Vout Linear (Exponent=-9)  
**Default Value:** As product specification  
**Units:** Volts (V)  
**Reference:**  
Section 8 – PMBus™ Spec Part II  
**Definition:** The VOUT_COMMAND command is used to set the output voltage normal value. The output voltage will be set as below formula. Attempt to write value outside of the acceptable range is treated as invalid data. Additionally, the value of VOUT_COMMAND remains unchanged. Maintaining value within “acceptable range” means:  
\[ MFR_\text{VOUT}_\text{MIN} < \text{VOUT}_\text{COMMAND} < MFR_\text{VOUT}_\text{MAX} \]  
For example, sending the VOUT_COMMAND command with the data bytes of 0x1800 will set the output to approximately 12V:  
\[
\text{Output Voltage} = \text{VOUT}_\text{COMMAND} \times 2^{\text{Exponent}}
\]
\[
=(0x1800) \times 2^{-9}
\]
\[
=6144 \times 2^{-9}
\]
\[
=12 \text{V}
\]

**VOUT_TRIM (22h)**

**Type:** Read Word/Write Word  
**Write Protectable:**  
**Data Number in Bytes:** 2
Data Format: Signed Vout Linear (Exponent=-9)
Default Value: 0x0000
Units: Volts (V)
Reference:
Section 8.3 – PMBus™ Spec Part II
Section 13.3 – PMBus™ Spec Part II
Definition: The VOUT_TRIM command is used to apply a fixed offset voltage to trim up/down the output voltage command value. The two bytes are formatted as a two’s complement binary mantissa, used in conjunction with the exponent set in VOUT_MODE as VOUT_COMMAND. The trim voltage will be set as below formula. Attempt to write value outside of the acceptable range is treated as invalid data. Additionally, the value of VOUT_TRIM remains unchanged. Maintaining value within “acceptable range” means:
MFR_VOUT_MIN < VOUT_TRIM+VOUT_COMMAND < MFR_VOUT_MAX
For example, sending the VOUT_TRIM command with the data bytes of 0x0100 will trim up the output to approximately 0.5V:

\[ \text{Trim Voltage} = \text{VOUT_TRIM} \times 2^{\text{Exponent}} \]
\[ = (0x0100) \times 2^{-9} \]
\[ = 256 \times 2^{-9} \]
\[ = 0.5 \text{ V} \]

VOUT_MARGIN_HIGH (25h)
Type: Read Word/Write Word
Write Protectable
Data Number in Bytes: 2
Data Format: Vout Linear (Exponent=-9)
Default Value: As product specification
Units: Volts (V)
Reference:
Section 8.3 – PMBus™ Spec Part II
Section 13.6 – PMBus™ Spec Part II
Definition: The VOUT_MARGIN_HIGH command is used to set the output voltage value for margin high operation. To enable the operation to output margin high, please refer to the OPERATION command. The margin high voltage will be set as below formula. Attempt to write value outside of the product specification range is treated as invalid data. Additionally, the value of VOUT_MARGIN_HIGH remains unchanged.
For example, sending the VOUT_MARGIN_HIGH command with the data bytes of 0x1A00 will change the output to approximately 13V:

\[ \text{Margin High Voltage} = \text{VOUT_MARGIN_HIGH} \times 2^{\text{Exponent}} \]
\[ = (0x1A00) \times 2^{-9} \]
\[ = 6656 \times 2^{-9} \]
\[ = 13 \text{ V} \]

VOUT_MARGIN_LOW (26h)
Type: Read Word/Write Word
Write Protectable
Data Number in Bytes: 2
Data Format: Vout Linear (Exponent=-9)
Default Value: As product specification
Units: Volts (V)
Reference:
Section 8.3 – PMBus™ Spec Part II
Section 13.7 – PMBus™ Spec Part II
Definition: The VOUT_MARGIN_LOW command is used to set the output voltage value for margin low operation. To enable the operation to output margin low, please refer to the OPERATION command. The margin low voltage will be set as below formula. Attempt to write value outside of the product specification range is treated as invalid data. Additionally, the value of VOUT_MARGIN_LOW remains unchanged. For example, sending the VOUT_MARGIN_LOW command with the data bytes of 0x1600 will change the output to approximately 11V:

\[
\text{Margin\_Low\_Voltage} = \text{VOUT\_MARGIN\_LOW} \times 2^{\text{Exponent}}
\]
\[
= (0x1600) \times 2^{-9}
\]
\[
= 5632 \times 2^{-9}
\]
\[
= 11\text{ V}
\]

VOUT_DROOP (28h)
Type: Read Word for User
Write Word for Manufacturer
Write Protectable
Data Number in Bytes: 2
Data Format: Droop Linear (Exponent=0)
Default Value: As product specification
Units: mV/A (mΩ)
Reference:
Section 8.3 – PMBus™ Spec Part II
Section 13.9 – PMBus™ Spec Part II
Definition: The VOUT_DROOP command is used to set the effective load line (V/I slope) of the output voltage. Output voltage is a function of output current. VOUT_DROOP data value only allow manufacturer to program. Users need to choose proper droop type product refer to specification or raise new requirement to manufacturer. For manufacturer, need to set MFR_CURRENT_SHARE_CONFIG (0xDB) command data to be 0x01 to active droop function, 0x00 to disable droop function. For example, the VOUT_DROOP command with the data bytes of 0x000F will set 15 mV/A droop slope.

VOUT_OV_FAULT_LIMIT (40h)
Type: Read Word/Write Word
Write Protectable
Data Number in Bytes: 2
Data Format: Vout Linear (Exponent=-9)
Default Value: As product specification
Units: Volts (V)
Reference:
Section 8.3 – PMBus™ Spec Part II
Section 15.2 – PMBus™ Spec Part II
Definition: The VOUT_OV_FAULT_LIMIT command is used to set the output overvoltage fault threshold. The threshold voltage will be set as below formula. Attempt to write value outside of the acceptable range is treated as invalid data. Additionally, the value of VOUT_OV_FAULT_LIMIT remains unchanged. Maintaining value within “acceptable range” means:
\[ VOUT_{OV\_WARN\_LIMIT} < VOUT_{OV\_FAULT\_LIMIT} < \text{Maximum clamp limit (Default in Specification)} \]
For example, sending the VOUT_OV_FAULT_LIMIT command with the data bytes of 0x1CCC will change the threshold voltage to approximately 14.4V:
\[
OV\_Fault\_Voltage = VOUT\_OV\_FAULT\_LIMIT \times 2^{\text{Exponent}}
\]
\[
= (0x1CCC) \times 2^{-9}
\]
\[
= 7372 \times 2^{-9}
\]
\[
= 14.4 \text{ V}
\]

### VOUT_OV_WARN_LIMIT (42h)

**Type:** Read Word/Write Word  
**Write Protectable:**

**Data Number in Bytes:** 2  
**Data Format:** Vout Linear (Exponent=-9)  
**Default Value:** As product specification  
**Units:** Volts (V)

**Reference:**
Section 8.3 – PMBus™ Spec Part II  
Section 15.4 – PMBus™ Spec Part II

**Definition:** The VOUT_OV_WARN_LIMIT command is used to set the output overvoltage warning threshold. The threshold voltage will be set as below formula. Attempt to write value outside of the acceptable range is treated as invalid data. Additionally, the value of VOUT_OV_WARN_LIMIT remains unchanged. Maintaining value within “acceptable range” means:

Minimum clamp limit (Default in Specification) < VOUT_OV_WARN_LIMIT < VOUT_OV_FAULT_LIMIT

For example, sending the VOUT_OV_WARN_LIMIT command with the data bytes of 0x1B00 will change the threshold voltage to approximately 13.5V:

\[
OV\_Warn\_Voltage = VOUT\_OV\_WARN\_LIMIT \times 2^{Exponent} \\
= (0x1B00) \times 2^{-9} \\
= 6912 \times 2^{-9} \\
= 13.5 \text{ V}
\]

### VOUT_UV_WARN_LIMIT (43h)

**Type:** Read Word/Write Word  
**Write Protectable:**

**Data Number in Bytes:** 2  
**Data Format:** Vout Linear (Exponent=-9)  
**Default Value:** As product specification  
**Units:** Volts (V)
Definition: The VOUT_OV_WARN_LIMIT command is used to set the output under voltage warning threshold. The threshold voltage will be set as below formula.
For example, sending the VOUT_OV_WARN_LIMIT command with the data bytes of 0x1200 will change the threshold voltage to approximately 9.0V:

\[
UV_{\text{Warn}}_{\text{Voltage}} = \text{VOUT}_{\text{UV}}_{\text{Warn}}_{\text{Limit}} \times 2^{\text{Exponent}} \\
= (0x1200) \times 2^{-9} \\
= 4608 \times 2^{-9} \\
= 9.0 \text{ V}
\]

Data Content:

<table>
<thead>
<tr>
<th>Data</th>
<th>Function</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits [15:8]</td>

</tbody>
</table>

VOUT_UV_FAULT_LIMIT (44h)

Type: Read Word/Write Word
Write Protectable

Data Number in Bytes: 2

Data Format: Vout Linear (Exponent=-9)

Default Value: As product specification

Units: Volts (V)

Reference:
Section 8.3 – PMBus™ Spec Part II
Section 15.6 – PMBus™ Spec Part II

Definition: The VOUT_UV_FAULT_LIMIT command is used to set the output under voltage fault threshold. The threshold voltage will be set as below formula.
For example, sending the VOUT_UV_FAULT_LIMIT command with the data bytes of 0x1000 will change the threshold voltage to approximately 8.0V:

\[
UV_{\text{Fault}}_{\text{Voltage}} = \text{VOUT}_{\text{UV}}_{\text{Fault}}_{\text{Limit}} \times 2^{\text{Exponent}} \\
= (0x1000) \times 2^{-9} \\
= 4096 \times 2^{-9} \\
= 8.0 \text{ V}
\]

Data Content:

IOUT_OC_FAULT_LIMIT (46h)

Type: Read Word/Write Word
Write Protectable

Data Number in Bytes: 2

Data Format: Iout Linear
(Exponent is not fixed, range from -16 to 15)

Default Value: As product specification
Units: Amperes (A)
Reference:
Section 7.1 – PMBus™ Spec Part II
Section 15.8 – PMBus™ Spec Part II
Definition: The IOUT_OC_FAULT_LIMIT command is used to set the the output overcurrent fault threshold. The threshold current will be set as below formula. Attempt to write value outside of the acceptable range is treated as invalid data. Additionally, the value of IOUT_OC_FAULT_LIMIT remains unchanged. Maintaining value within “acceptable range” means:

\[ I_{OUT\_OC\_WARN\_LIMIT} < I_{OUT\_OC\_FAULT\_LIMIT} < \text{Maximum clamp limit (Default in Specification)} \]

For example, sending the IOUT_OC_FAULT_LIMIT command with the data bytes of 0xE320 (Exponent=11100b, Mantissa=01100100000b) will change the threshold current to approximately 50.0A:

\[
OC\_Fault\_Current = \text{Mantissa} \times 2^{\text{Exponent}} \\
= (01100100000b) \times 2^{(11100b)} \\
= (800) \times 2^{-4} \\
= 50.0 \text{ A}
\]

Note that for inverse calculation to write right data, exponent value selected should not result in data overflow of the whole linear data.

**IOUT_OC_WARN_LIMIT (4Ah)**

**Type:** Read Word/Write Word  
**Write Protectable:**

**Data Number in Bytes:** 2  
**Data Format:** Iout Linear  
(Exponent is not fixed, range from -16 to 15)

**Default Value:** As product specification  
**Units:** Amperes (A)

**Reference:**  
Section 7.1 – PMBus™ Spec Part II  
Section 15.12 – PMBus™ Spec Part II

**Definition:** The IOUT_OC_WARN_LIMIT command is used to set the output overcurrent warn threshold. The threshold current will be set as below formula. Attempt to write value outside of the acceptable range is treated as invalid data. Additionally, the value of IOUT_OC_WARN_LIMIT remains unchanged. Maintaining value within “acceptable range” means:  

\[
IOUT\_OC\_WARN\_LIMIT < IOUT\_OC\_FAULT\_LIMIT
\]

For example, sending the IOUT_OC_WARN_LIMIT command with the data bytes of 0xE2E8 (Exponent=11100b, Mantissa=01011101000b) will change the threshold current to approximately 46.5A:

\[
OC\_Warn\_Current = Mantissa \times 2^{Exponent} \\
= (01011101000b) \times 2^{11100b} \\
= (744) \times 2^{-4} \\
= 46.5 \text{ A}
\]

Note that for inverse calculation to write right data, exponent value selected should not result in data overflow of the whole linear data.

**Data Content:**

**OT_FAULT_LIMIT (4Fh)**

*Type:* Read Word/Write Word  
*Write Protectable*

*Data Number in Bytes:* 2  
*Data Format:* TEMP Linear (Exponent= 0)  
*Default Value:* As product specification  
*Units:* Celsius (°C)

**Reference:**  
Section 7.1 – PMBus™ Spec Part II  
Section 15.17 – PMBus™ Spec Part II

**Definition:** The OT_FAULT_LIMIT command is used to set the over-temperature fault threshold. The threshold temperature will be set as below formula. Attempt to write value outside of the acceptable range is treated as invalid data. Additionally, the value of OT_FAULT_LIMIT remains unchanged. Maintaining value within “acceptable range” means:  
\[ OT_WARN_LIMIT < OT_FAULT_LIMIT < \text{Maximum clamp limit (Default in Specification)} \]

For example, sending the OT_FAULT_LIMIT command with the data bytes of 0x007D (Exponent=00000b, Mantissa=00001111101b) will change the threshold temperature to approximately 125°C:

\[
\text{OT_Fault_Temperature} = \text{Mantissa} \times 2^{\text{Exponent}}
\]
\[
= (00001111101b) \times 2^{(00000b)}
\]
\[
= (125) \times 2^0
\]
\[
= 125°C
\]

Note that for inverse calculation to write right data, exponent value selected should not result in data overflow of the whole linear data.

### OT_WARN_LIMIT (51h)

**Type:** Read Word/Write Word  
**Write Protectable:** No  
**Data Number in Bytes:** 2  
**Data Format:** TEMP Linear (Exponent = 0)  
**Default Value:** As product specification  
**Units:** Celsius (°C)  
**Reference:**  
Section 7.1 – PMBus™ Spec Part II  
Section 15.19 – PMBus™ Spec Part II  
**Definition:** The OT_WARN_LIMIT command is used to set the over-temperature warn threshold. The threshold temperature will be set as below formula. Attempt to write value outside of the acceptable range is treated as invalid data. Additionally, the value of OT_WARN_LIMIT remains unchanged. Maintaining value within “acceptable range” means:
**OT_WARN_LIMIT < OT_FAULT_LIMIT**

For example, sending the OT_WARN_LIMIT command with the data bytes of 0x0078 (Exponent=00000b, Mantissa=00001111000b) will change the threshold temperature to approximately 120°C:

\[
\text{OT\_Warn\_Temperature} = \text{Mantissa} \times 2^{\text{Exponent}} = (00001111000b) \times 2^{(00000b)} = (120) \times 2^0 = 120^\circ C
\]

Note that for inverse calculation to write right data, exponent value selected should not result in data overflow of the whole linear data.

**VIN_OV_FAULT_LIMIT (55h)**

*Type:* Read Word/Write Word

*Write Protectable*

*Data Number in Bytes:* 2

*Data Format:* Vin Linear

(Exponent is not fixed, range from -16 to 15)

*Default Value:* As product specification

*Units:* Volts (V)

*Reference:*

- Section 7.1 – PMBus™ Spec Part II
- Section 15.23 – PMBus™ Spec Part II

*Definition:* The VIN_OV_FAULT_LIMIT command is used to set the input overvoltage fault threshold. The threshold voltage will be set as below formula. Attempt to write value outside of the acceptable range is treated as invalid data. Additionally, the value of VIN_OV_FAULT_LIMIT remains unchanged. Maintaining value within “acceptable range” means:

\[
\text{VIN\_OV\_WARN\_LIMIT} < \text{VIN\_OV\_FAULT\_LIMIT} < \text{Maximum clamp limit (Default in Specification)}
\]

For example, sending the VIN_OV_FAULT_LIMIT command with the data bytes of 0xEA80 (Exponent=11101b, Mantissa=01010000000b) will change the threshold voltage to approximately 80.0V:

\[
\text{OV\_Fault\_Voltage} = \text{Mantissa} \times 2^{\text{Exponent}} = (01010000000b) \times 2^{(11101b)} = (640) \times 2^{-3} = 80.0 \text{ V}
\]

Note that for inverse calculation to write right data, exponent value selected should not result in data overflow of the whole linear data.

**VIN_UV_WARN_Limit (58h)**

**Type:** Read Word/Write Word

**Write Protectable**

**Data Number in Bytes:** 2

**Data Format:** Vin Linear

(Exponent is not fixed, range from -16 to 15)

**Default Value:** As product specification

**Units:** Volts (V)

Reference:
Section 7.1 – PMBus™ Spec Part II
Section 15.26 – PMBus™ Spec Part II

Definition: The VIN_UV_WARN_Limit command is used to set the input under voltage warning threshold. The threshold voltage will be set as below formula. Attempt to write value outside of the acceptable range is treated as invalid data. Additionally, the value of VIN_UV_WARN_Limit remains unchanged. Maintaining value within “acceptable range” means:

VIN_UV_FAULT_LIMIT < VIN_UV_WARN_Limit < Vin on limit (Default in Specification)

For example, sending the VIN_UV_WARN_Limit command with the data bytes of 0xE910 (Exponent=11101b, Mantissa=00100010000b) will change the threshold voltage to approximately 34.0V:

\[ UV\_Warn\_Voltage = Mantissa \times 2^{Exponent} \]
\[ = (00100010000b) \times 2^{(11101b)} \]
\[ = (272) \times 2^{-3} \]
\[ = 34.0 \text{ V} \]

Note that for inverse calculation to write right data, exponent value selected should not result in data overflow of the whole linear data.
**VIN_UV_FAULT_LIMIT (59h)**

**Type:** Read Word/Write Word

**Write Protectable**

**Data Number in Bytes:** 2

**Data Format:** Vin Linear

(Exponent is not fixed, range from -16 to 15)

**Default Value:** As product specification

**Units:** Volts (V)

**Reference:**
- Section 7.1 – PMBus™ Spec Part II
- Section 15.27 – PMBus™ Spec Part II

**Definition:** The VIN_UV_FAULT_LIMIT command is used to set the input under voltage fault threshold. The threshold voltage will be set as below formula. Attempt to write value outside of the acceptable range is treated as invalid data. Additionally, the value of VIN_UV_FAULT_LIMIT remains unchanged. Maintaining value within “acceptable range” means:

\[
\text{Vin off limit (Default in Specification)} < \text{VIN_UV_FAULT_LIMIT} < \text{VIN_UV_WARN_LIMIT}
\]

For example, sending the VIN_UV_FAULT_LIMIT command with the data bytes of 0xE904 (Exponent=11101b, Mantissa=00100000100b) will change the threshold voltage to approximately 32.5V:

\[
\text{UV_Fault Voltage} = \text{Mantissa} \times 2^{\text{Exponent}}
\]

\[
= (00100010000b) \times 2^{(11101b)}
\]

\[
= (260) \times 2^{-3}
\]

\[
= 32.5 \text{ V}
\]

Note that for inverse calculation to write right data, exponent value selected should not result in data overflow of the whole linear data.

TON_DELAY (60h)

Type: Read Word/Write Word
Write Protectable

Data Number in Bytes: 2

Data Format: Time Linear (Exponent=0)

Default Value: 0x0000

Units: ms
Reference:
Section 7.1 – PMBus™ Spec Part II
Section 16.1 – PMBus™ Spec Part II

**Definition:** The TON_DELAY command is used to set the delay time, in milliseconds, from when a start condition is received (as programmed by the ON_OFF_CONFIG command) until the output voltage starts to rise. Note that if the module has current share function, TON_DELAY will not allow user to change. Attempt to write value outside of the acceptable range is treated as invalid data. Additionally, the value of TON_DELAY remains unchanged. Maintaining value within “acceptable range” means:

Minimum clamp limit (Default in Specification) < TON_DELAY < Maximum clamp limit (Default in Specification)

For example, the TON_DELAY command with the data bytes of 0x0019 will set 25 ms delay time. Common range is from 1ms to 500ms.

TOFF_FALL (65h)

Type: Read Word/Write Word
Write Protectable

Data Number in Bytes: 2

Data Format: Time Linear (Exponent=0)

Default Value: As product specification

Units: ms

Reference: Section 7.1 – PMBus™ Spec Part II
Section 16.6 – PMBus™ Spec Part II

Definition: The TOFF_FALL command is used to set the time, in milliseconds, from the end of the turn-off delay time (TOFF_DELAY) until the voltage is commanded to zero. Note that if the module has no soft off function, TOFF_FALL will not active. If the module has current share function, TOFF_DELAY will not allow user to change.

Data Range: Attempt to write value outside of the acceptable range is treated as invalid data. Additionally, the value of TOFF_FALL remains unchanged. Maintaining value within “acceptable range” means:

Minimum clamp limit (Default in Specification) < TOFF_FALL < Maximum clamp limit (Default in Specification)

For example, the TOFF_FALL command with the data bytes of 0x000A will set 10 ms delay time. Common range is from 10ms to 100ms.

**STATUS_WORD (79h)**

**Type:** Read Word
- Write Word (only 0100h)
- Write Protectable

**Data Number in Bytes:** 2

**Data Format:** Bit field

**Default Value:** 0x0000

**Units:** N/A

**Reference:**
- Section 17.2 – PMBus™ Spec Part II
- Section 10.2.5.3 – PMBus™ Spec Part II

**Definition:** The STATUS.Word command is used for host to read two bytes of information with a summary of the unit’s fault condition. A bit value of 1 indicates a fault or warning event has occurred and a bit value of 0 indicates that a fault or warning event has not occurred. To directly clear the UNKNOWN bit, send the STATUS_WORD command with the data bytes 0x0100 using the WRITE WORD protocol.

**Data Range:** N/A

**Data Content:**

<table>
<thead>

## Bit [13]
**INPUT. Input voltage, input current, or input power fault or warning.**
- **Value**: 1
  - Description: Fault has occurred.
- **Value**: 0
  - Description: Fault is not occurred or cleared.

## Bit [12]
**MFR_SPECIFIC. Manufacturer specific fault or warning.**
- **Value**: 1
  - Description: Fault has occurred.
- **Value**: 0
  - Description: Fault is not occurred or cleared.

## Bit [11]
**POWER_GOOD#. Show that output power is not good or not.**
- **Value**: 1
  - Description: Fault has occurred.
- **Value**: 0
  - Description: Fault is not occurred or cleared.

## Bit [10]
**FANS. Fan or airflow fault or warning.**
- **Value**: 1
  - Description: Fault has occurred.
- **Value**: 0
  - Description: Fault is not occurred or cleared.

## Bit [9]
**OTHER. The bit in STATUS_OTHER is set or not.**
- **Value**: 1
  - Description: Fault has occurred.
- **Value**: 0
  - Description: Fault is not occurred or cleared.

## Bit [8]
**UNKNOWN. Fault type not given in bits [15:1] of the STATUS_WORD.**
- **Value**: 1
  - Description: Fault has occurred.
- **Value**: 0
  - Description: Fault is not occurred or cleared.

## Bits [7:0]
As STATUS_BYTE command data contents.

### STATUS_VOUT (7Ah)

**Type:** Read Byte
- Write Byte (only XX000000b)
  - Write Protectable

**Data Number in Bytes:** 1

**Data Format:** Bit field

**Default Value:** 0x00

**Units:** N/A

**Reference:**
- Section 17.3 – PMBus™ Spec Part II
- Section 10.2.4 – PMBus™ Spec Part II

**Definition:**
The STATUS_VOUT command is used for host to read one byte of information with a summary of the output voltage related status. A bit read value of 1 indicates a fault or warning event has occurred and a bit value of 0 indicates that a fault or warning event has not occurred.

However, a bit write value of 1 by host indicates to clear a fault or warning event and a bit value of 0 indicates that a fault or warning event do not need to clear.

**Data Range:** XX000000b for write. X is a bit value and can be written to 1 or 0.
For example, write 40h to only clear bit [6], 80h to only clear bit [7], and C0h to clear bit [6] and bit [7].

**Data Content:**

<table>
<thead>
<tr>
<th>Data</th>
<th>Function</th>
<th>Bit Value</th>
<th>Description</th>
<th>Default Value “0x00”</th>
</tr>
</thead>

<td>VOUT_OV_WARNING. Output Overvoltage Warning.</td>
<td>1</td>
<td>Fault has occurred.</td>
<td>0</td>
</tr>
<tr>
<td>Bit [5]</td>
<td>VOUT_UV_WARNING. Output Under voltage Warning.</td>
<td>1</td>
<td>Fault has occurred.</td>
<td>0</td>
</tr>
<tr>
<td>Bit [4]</td>
<td>VOUT_UV_FAULT. Output Under voltage Fault.</td>
<td>1</td>
<td>Fault has occurred.</td>
<td>0</td>
</tr>
<tr>
<td>Bit [3]</td>
<td>VOUT_MAX Warning. An attempt has been made to set the output voltage to value higher than allowed by the VOUT_MAX command.</td>
<td>1</td>
<td>Fault has occurred.</td>
<td>0</td>
</tr>
</tbody>
</table>
### STATUS_IOUT (7Bh)

**Type:** Read Byte  
**Write Byte (only X000000b)**  
**Write Protectable**  

**Data Number in Bytes:** 1  
**Data Format:** Bit field  
**Default Value:** 0x00  
**Units:** N/A  

**Reference:**  
Section 17.4 – PMBus™ Spec Part II  
Section 10.2.4 – PMBus™ Spec Part II  

**Definition:** The STATUS_IOUT command is used for host to read one byte of information with a summary of the output current related status. A bit read value of 1 indicates a fault or warning event has occurred and a bit value of 0 indicates that a fault or warning event has not occurred. However, a bit write value of 1 by host indicates to clear a fault or warning event and a bit value of 0 indicates that a fault or warning event do not need to clear.  

**Data Range:** X000000b for write. **X** is a bit value and can be written to 1 or 0.  
For example, write 20h to only clear bit [5], 80h to only clear bit [7], and A0h to clear bit [5] and bit [7].

---

**READ_VIN (88h)**

**Type:** Read Word  
**Data Number in Bytes:** 2  
**Data Format:** Vin Linear  
(Exponent is not fixed, range from -16 to 15)  
**Default Value:** As product specification  
**Units:** Volts (V)  
**Reference:**  
Section 7.1 – PMBus™ Spec Part II  
Section 18.1 – PMBus™ Spec Part II  
**Definition:** The `READ_VIN` command is used to read the measured value of input voltage. For example, sending the `READ_VIN` command and reading out 0xE910 (Exponent=11101b, Mantissa=00100010000b), shows that input voltage is approximately 34.0V:  

\[
Vin_{\text{Voltage}} = Mantissa \times 2^{Exponent} \\
= (00100010000b) \times 2^{(11101b)} \\
= (272) \times 2^{-3} \\
= 34.0 \text{ V}
\]

**Data Content:**

<table>
<thead>
<tr>
<th>Data</th>

<td>Mantissa, a 11 bits two's complement</td>
<td></td>
</tr>
</tbody>
</table>

---

**READ_VOUT (8Bh)**

**Type:** Read Word  
**Data Number in Bytes:** 2  
**Data Format:** Vout Linear (Exponent =-9)  
**Default Value:** As product specification  
**Units:** Volts (V)  
**Reference:**  
Section 8.3 – PMBus™ Spec Part II  
Section 18.4 – PMBus™ Spec Part II  
**Definition:** The `READ_VOUT` command is used to read the measured value of output voltage.
For example, sending the READ_VOUT command and reading out 0x1800, shows that output voltage is approximately 12.0V:

\[
\text{Output\ Voltage} = \text{READ\ VOUT} \times 2^{\text{Exponent}} = (0x1800) \times 2^{-9} = 6144 \times 2^{-9} = 12 \text{ V}
\]

</tr>
</thead>
<tbody>
<tr>
<td>Bits [15:8]</td>
</tr>
<tr>
<td>Bits [7:0]</td>
</tr>
</tbody>
</table>

**READ_IOUT (8Ch)**

Type: Read Word
Data Number in Bytes: 2
Data Format: Iout Linear
(Exponent is not fixed, range from -16 to 15)
Default Value: As product specification
Units: Amperes (A)
Reference:
Section 7.1 – PMBus™ Spec Part II
Section 18.5 – PMBus™ Spec Part II

Definition: The READ_IOUT command is used to read the measured value of output current.
For example, sending the READ_IOUT command and reading out 0xE320 (Exponent=11100b, Mantissa=01100100000b), shows that output current is approximately 50.0A:

\[
\text{Output\ Current} = \text{Mantissa} \times 2^{\text{Exponent}} = (01100100000b) \times 2^{(11100b)} = (800) \times 2^{-4} = 50.0 \text{ A}
\]

</tr>
<tr>
<td>Bits [10:0]</td>
</tr>
</tbody>
</table>

**READ_TEMPERATURE_1 (8Dh)**

Type: Read Word
Data Number in Bytes: 2
Data Format: TEMP Linear
(Exponent is not fixed, range from -16 to 15)
Default Value: As product specification
Units: Celsius (°C)
Reference:
Section 7.1 – PMBus™ Spec Part II
Section 18.6 – PMBus™ Spec Part II

Definition: The READ_TEMPERATURE_1 command is used to read the measured value of PCB sense point temperature and also for over temperature protection.
For example, sending the READ_TEMPERATURE_1 command and reading out 0xF0A2 (Exponent= 11110b, Mantissa=00010100010b), shows that temperature is approximately 40.5°C:

\[
\text{Temperature} = \text{Mantissa} \times 2^{\text{Exponent}} \\
= (00010100010b) \times 2^{(11110b)} \\
= (162) \times 2^{-2} \\
= 40.5^\circ C
\]

Data Content:

<td></td>
</tr>
</tbody>
</table>

**READ_TEMPERATURE_2 (8Eh)**

Type: Read Word  
Data Number in Bytes: 2  
Data Format: TEMP Linear  
(Exponent is not fixed, range from -16 to 15)  
Default Value: As product specification  
Units: Celsius (°C)  
Reference:  
Section 7.1 – PMBus™ Spec Part II  
Section 18.6 – PMBus™ Spec Part II  
Definition: The READ_TEMPERATURE_2 command is used to read the measured value of sense point temperature. In most cases, READ_TEMPERATURE_2 equals READ_TEMPERATURE_1. For example, sending the READ_TEMPERATURE_2 command and reading out 0xF0A2 (Exponent= 11110b, Mantissa=00010100010b), shows that temperature is approximately 40.5°C:

\[
\text{Temperature} = \text{Mantissa} \times 2^{\text{Exponent}} \\
= (00010100010b) \times 2^{(11110b)} \\
= (162) \times 2^{-2} \\
= 40.5^\circ C
\]

</tr>
<tr>
<td>[10:0]</td>
<td>Mantissa, a 11 bits two’s complement</td>
<td></td>
</tr>
</tbody>
</table>

**READ_DUTY_CYCLE (94h)**

Type: Read Word  
Data Number in Bytes: 2  
Data Format: Duty Linear  
(Exponent is not fixed, range from -16 to 15)  
Default Value: As product specification  
Units: Percent (%)  
Reference:  
Section 7.1 – PMBus™ Spec Part II  
Section 18.9 – PMBus™ Spec Part II
**Definition:** The READ_DUTY_CYCLE command is used to read the measured duty percent. For example, sending the READ_DUTY_CYCLE command and reading out 0xE236 (Exponent= 11100b, Mantissa=01000110110b), shows that duty is approximately 35.4%:

\[
\text{Duty Cycle} = \text{Mantissa} \times 2^{\text{Exponent}}
\]

\[
= (01000110110b) \times 2^{11100b}
\]

\[
= (566) \times 2^{-4}
\]

\[
= 35.4\%
\]

**Data Content:**

<table>
<thead>

**READ_FREQUENCY (95h)**

Type: Read Word

Data Number in Bytes: 2

Data Format: Freq Linear

Default Value: As product specification

Units: Kilo Hertz (kHz)

Reference:

- Section 7.1 – PMBus™ Spec Part II
- Section 18.10 – PMBus™ Spec Part II

**Definition:** The READ_FREQUENCY command is used to read the switching frequency. For example, sending the READ_FREQUENCY command and reading out 0xF208 (Exponent= 11110b, Mantissa=01000001000b), shows that frequency is approximately 130 kHz:

\[
\text{Frequency} = \text{Mantissa} \times 2^{\text{Exponent}}
\]

\[
= (01000001000b) \times 2^{11110b}
\]

\[
= (520) \times 2^{-2}
\]

\[
= 130\ kHz
\]

**Data Content:**

**READ_POUT (96h)**

Type: Read Word

Data Number in Bytes: 2

Data Format: Freq Linear

Default Value: As product specification

Units: Watts (W)

Reference:

- Section 7.1 – PMBus™ Spec Part II
- Section 18.11 – PMBus™ Spec Part II

**Definition:** The READ_POUT command is used to read the output power.

www.murata-ps.com/support
For example, sending the READ_POUT command and reading out 0xF208 (Exponent=11110b, Mantissa= 01000001000b), shows that output power is approximately 130 W:

\[
\text{Output Power} = \text{Mantissa} \times 2^{\text{Exponent}} = (01000001000b) \times 2^{11110b} = (520) \times 2^{-2} = 130 \text{ W}
\]

**MFR_ID (99h)**
- **Type:** Read Block
- **Data Number in Bytes:** 22
- **Data Format:** ASCII
- **Default Value:** Murata Power Solutions
- **Units:** N/A
- **Reference:** Section 22.2 – PMBus™ Spec Part II
- **Definition:** The MFR_ID command is used to read manufacturer name for user and only allow write by manufacturer. For example, sending the MFR_ID command and reading out 0x4D757261746120506F77657220536F6C75746966F6E73, shows that manufacturer is Murata Power Solutions.

**MFR_MODEL (9Ah)**
- **Type:** Read Block/ Write Block
- **Write Protectable**
Data Number in Bytes:
Data Format: ASCII
Default Value: As product specification
Units: N/A
Reference:
   - Section 22.2 – PMBus™ Spec Part II

Definition: The MFR_MODEL command is used to read the name of manufacturer’s model number for user and only allow write by manufacturer. For example, sending the MFR_MODEL command and reading out 0x4442512D31302F32302D4E43, shows that model name is DBQ-10/20-NBC.

MFR_REVISION (9Bh)
Type: Read Block/ Write Block
   - Write Protectable
Data Number in Bytes:
Data Format: ASCII
Default Value: As product specification
Units: N/A
Reference:
   - Section 22.2 – PMBus™ Spec Part II

Definition: The MFR_REVISION command is used to read the revision of firmware for user and only allow write by manufacturer. For example, sending the MFR_REVISION command and reading out 0x41, shows that model firmware is version A.

MFR_LOCATION (9Ch)
Type: Read Block/ Write Block
   - Write Protectable
Data Number in Bytes:
Data Format: ASCII
Default Value: As product specification
Units: N/A
Reference:
   - Section 22.2 – PMBus™ Spec Part II

Definition: The MFR LOCATION command is used to read the manufacturing location for user and only allow write by manufacturer. For example, sending the MFR_LOCATION command and reading out 0x4D75726174612C5348, shows that location is Murata,SH.

MFR_DATE (9Dh)
Type: Read Block/ Write Block
   - Write Protectable
Data Number in Bytes:
Data Format: ASCII
Default Value: As product specification
Units: N/A
Reference:
   - Section 22.2 – PMBus™ Spec Part II

Definition: The MFR_DATE command is used to read the date for user and only allow write by manufacturer. For example, sending the MFR_DATE command and reading out 0x30382F31362F32303136, shows that date is 08/16/2016.

MFR_SERIAL (9Eh)
Type: Read Block/ Write Block
   - Write Protectable
Data Number in Bytes:
Data Format: ASCII
Default Value: As product specification
Units: N/A
Reference:
Section 22.2 – PMBus™ Spec Part II
Definition: The MFR_SERIAL command is used to read the model serial for user and only allow write by manufacturer. For example, sending the MFR_SERIAL command and reading out 0x3030313433423632314147, shows that date is 00143B621AG.

MFR_VIN_MIN (A0h)
Type: Read Word
Data Number in Bytes: 2
Data Format: Vin Linear
(Exponent is not fixed, range from -16 to 15)
Default Value: As product specification
Units: Volts (V)
Reference:
Section 22.3 – PMBus™ Spec Part II
Definition: The MFR_VIN_MIN command is used to read the minimum input voltage.
For example, sending the MFR_VIN_MIN command and reading out 0x0024 (Exponent=00000b, Mantissa= 00000100100b), shows that minimum input voltage is approximately 36V:

\[
\text{Min\_input\_Voltage} = \text{Mantissa} \times 2^{\text{Exponent}} \\
= (00000100100b) \times 2^{(00000b)} \\
= 36 \times 2^0 \\
= 36 \text{ V}
\]

MFR_VIN_MAX (A1h)
Type: Read Word
Data Number in Bytes: 2
Data Format: Vin Linear
(Exponent is not fixed, range from -16 to 15)
Default Value: As product specification
Units: Volts (V)
Reference:
Section 22.3 – PMBus™ Spec Part II
Definition: The MFR_VIN_MAX command is used to read the maximum input voltage.
For example, sending the MFR_VIN_MAX command and reading out 0x004B (Exponent=00000b, Mantissa= 00001001011b), shows that maximum input voltage is approximately 75V:

\[
\text{Max\_input\_Voltage} = \text{Mantissa} \times 2^{\text{Exponent}} \\
= (00001001011b) \times 2^{(00000b)} \\
= 75 \times 2^0 \\
= 75 \text{ V}
\]

**MFR_IIN_MAX (A2h)**

- **Type:** Read Word
- **Data Number in Bytes:** 2
- **Data Format:** Lin Linear
  
  (Exponent is not fixed, range from -16 to 15)
- **Default Value:** As product specification
- **Units:** Amperes (A)
- **Reference:** Section 22.3 – PMBus™ Spec Part II
- **Definition:** The MFR_IIN_MAX command is used to read the maximum input current.
  
  For example, sending the MFR_IIN_MAX command and reading out 0xE0C8 (Exponent=11100b, Mantissa=00011001000b), shows that maximum input current is approximately 12.5A:

\[
\text{Max\_input\_Current} = \text{Mantissa} \times 2^{\text{Exponent}} \\
= (00011001000b) \times 2^{11100b} \\
= (200) \times 2^{-4} \\
= 12.5 A
\]

</tbody>
</table>

**MFR_PIN_MAX (A3h)**

- **Type:** Read Word
- **Data Number in Bytes:** 2
- **Data Format:** Pin Linear
  
  (Exponent is not fixed, range from -16 to 15)
- **Default Value:** As product specification
- **Units:** Watts (W)
- **Reference:** Section 22.3 – PMBus™ Spec Part II
- **Definition:** The MFR_PIN_MAX command is used to read the maximum input power.
  
  For example, sending the MFR_PIN_MAX command and reading out 0x01C2 (Exponent=00000b, Mantissa=00111000010b), shows that maximum input power is approximately 450W:

\[
\text{Max\_input\_Power} = \text{Mantissa} \times 2^{\text{Exponent}} \\
= (00111000010b) \times 2^{00000b} \\
= (450) \times 2^0 \\
= 450 W
\]
### MFR_VOUT_MIN (A4h)

**Type:** Read Word  
**Data Number in Bytes:** 2  
**Data Format:** Vout Linear (Exponent=-9)  
**Default Value:** As product specification  
**Units:** Volts (V)  
**Reference:**  
Section 8.3 – PMBus™ Spec Part II  
Section 22.3 – PMBus™ Spec Part II  
**Definition:** The MFR_VOUT_MIN command is used to read the minimum output voltage.  
For example, sending the MFR_VOUT_MIN command and reading out 0x1033 (Mantissa=000100 0001100110b), shows that minimum output voltage is approximately 8.1V:

\[
\text{Min\_output\_Voltage}=\text{Mantissa} \times 2^{\text{Exponent}}  
= (00111000010b) \times 2^{-9}  
= (4147) \times 2^{-9}  
= 8.1 \text{ V}
\]

### MFR_VOUT_MAX (A5h)

**Type:** Read Word  
**Data Number in Bytes:** 2  
**Data Format:** Vout Linear (Exponent=-9)  
**Default Value:** As product specification  
**Units:** Volts (V)  
**Reference:**  
Section 8.3 – PMBus™ Spec Part II  
Section 22.3 – PMBus™ Spec Part II  
**Definition:** The MFR_VOUT_MAX command is used to read the minimum output voltage.  
For example, sending the MFR_VOUT_MAX command and reading out 0x1A00 (Mantissa=00011 01000000000b), shows that maximum output voltage is approximately 13.0V:

\[
\text{Max\_output\_Voltage}=\text{Mantissa} \times 2^{\text{Exponent}}  
= (0001101000000000b) \times 2^{-9}  
= (6656) \times 2^{-9}  
= 13.0 \text{ V}
\]

*Units:* N/A  
*Reference:* N/A  
*Definition:* The MFR_PGOOD_POLARITY command is used for manufacturer to configure POWER_GOOD polarity after action.
### MFR_VIN_OV_FAULT_HYS (E8h)

**Type:** Read Word/Write Word  
Write Protectable  

**Data Number in Bytes:** 2  

**Data Format:** TEMP Linear  
(Exponent is not fixed, range from -16 to 15)

**Default Value:** N/A  

**Units:** Volts(V)

**Reference:** Section 7.1 – PMBus™ Spec Part II

**Definition:** The MFR_VIN_OV_FAULT_HYS command is used for manufacturer to configure input overvoltage fault hysteresis range.  

**Data Range:** Attempt to write value outside of the acceptable range is treated as invalid data. Additionally, the value of MFR_VIN_OV_FAULT_HYS remains unchanged. Maintaining value within “acceptable range” means:  

Minimum clamp limit (Default in Specification) < MFR_VIN_OV_FAULT_HYS < Maximum clamp limit (Default in Specification)

For example, the MFR_VIN_OV_FAULT_HYS command with the data bytes of 0xE010 (Exponent= 11100b, Mantissa=0000010000b), shows that hysteresis voltage is approximately 1V. Common range is from 0V to 2V.

\[
\text{Hys\_Voltage} = \text{Mantissa} \times 2^{\text{Exponent}}  
= (0000010000b) \times 2^{11100b}  
= (16) \times 2^{-4}  
= 1 \text{ V}
\]

### MFR_VIN_UV_FAULT_HYS (E9h)

**Type:** Read Word/Write Word  
Write Protectable  

**Data Number in Bytes:** 2  

**Data Format:** TEMP Linear  
(Exponent is not fixed, range from -16 to 15)

**Default Value:** N/A  

**Units:** Volts(V)

**Reference:** Section 7.1 – PMBus™ Spec Part II

**Definition:** The MFR_VIN_UV_FAULT_HYS command is used for manufacturer to configure input voltage under voltage fault hysteresis range.  

**Data Range:** Attempt to write value outside of the acceptable range is treated as invalid data. Additionally, the value of MFR_VIN_UV_FAULT_HYS remains unchanged. Maintaining value within “acceptable range” means:  

Minimum clamp limit (Default in Specification) < MFR_VIN_UV_FAULT_HYS < Maximum clamp limit (Default in Specification)

For example, the MFR_VIN_UV_FAULT_HYS command with the data bytes of 0xE010 (Exponent= 11100b, Mantissa=0000010000b), shows that hysteresis voltage is approximately 1V. Common range is from 0V to 2V.

MFR\_OT\_FAULT\_HYS (EAh)

Type: Read Word/Write Word
Write Protectable
Data Number in Bytes: 2
Data Format: TEMP Linear (Exponent = 0)
Default Value: N/A
Units: Celsius (°C)
Reference: Section 7.1 – PMBus™ Spec Part II
Definition: The MFR\_OT\_FAULT\_HYS command is used for manufacturer to configure over temperature fault hysteresis range.
Data Range: Attempt to write value outside of the acceptable range is treated as invalid data. Additionally, the value of MFR\_OT\_FAULT\_HYS remains unchanged. Maintaining value within “acceptable range” means:

Minimum clamp limit (Default in Specification) < MFR\_OT\_FAULT\_HYS < Maximum clamp limit (Default in Specification)

For example, the MFR\_OT\_FAULT\_HYS command with the data bytes of 0x0005 (Exponent= 00000b, Mantissa=00000000101b), shows that hysteresis temperature is approximately 5°C. Common range is from 5°C to 50°C.

Hys\_OT=Mantissa*2^{Exponent}\\
=\left(00000000101_2\right)*2^{\left(00000_2\right)}\\
=\left(5\right)*2^{0}\\
=5\,\text{°C}

MFR\_CALIBRATION\_STATUS (F6h)

Type: Read Byte
Data Number in Bytes: 1
Data Format: Bit field
Default Value: 0x07
Units: N/A
Reference: N/A
Definition: The MFR\_CALIBRATION\_STATUS command is used for manufacturer to check calibration result after calibration action.

MFR_VIN_SENSE_CALIBRATION (F9h)

Type: Write Byte
Data Number in Bytes: 1
Data Format: Bit field
Default Value: N/A
Units: N/A
Reference: N/A
Definition: The MFR_VIN_SENSE_CALIBRATION command is used for manufacturer to calibrate input voltage reading. If calibration is success, bit [2] from MFR_CALIBRATION_STATUS command reading data will be set to 1.
Data Range: Attempt to write value outside of the acceptable range is treated as invalid data. Common range is from 0x01 to 0x08.

MFR_IOUT_SENSE_CALIBRATION (FAh)

Type: Write Word
Data Number in Bytes: 2
Data Format: Iout Linear
(Exponent is not fixed, range from -16 to 15)
Default Value: As product specification
Units: Amperes (A)
Reference: Section 7.1 – PMBus™ Spec Part II
Definition: The MFR_IOUT_SENSE_CALIBRATION command is used for manufacturer to calibrate output current reading. If calibration is success, bit [1] from MFR_CALIBRATION_STATUS command reading data will be set to 1.
For example, sending the MFR_IOUT_SENSE_CALIBRATION command and writing data 0xE0C8 (Exponent=11100b, Mantissa=00011001000b), shows that output current is actual 12.5A:

\[
\text{Calibration Output Current} = \text{Mantissa} \times 2^{\text{Exponent}} \\
= (00011001000b) \times 2^{11100b} \\
= (200) \times 2^{-4} \\
= 12.5 \text{ A}
\]
**MFR_VOUT_SET_POINT_CALIBRATION (FBh)**

Type: Write Word  
Data Number in Bytes: N/A  
Data Format: Vout Linear (Exponent = -9)  
Default Value: As product specification  
Units: Volts (V)  
Reference: Section 8.3 – PMBus™ Spec Part II  

**Definition:** The MFR_VOUT_SET_POINT_CALIBRATION command is used for manufacturer to calibrate output voltage setting. If calibration is success, bit [0] from MFR_CALIBRATION_STATUS command reading data will be set to 1.

For example, sending the MFR_VOUT_SET_POINT_CALIBRATION command and writing data 0x1033 (Mantissa=0001000000110011b), shows that output voltage is set to approximately 8.1V:

\[
\text{Output\ Voltage} = \text{Mantissa} \times 2^{\text{Exponent}} \\
=(00111000010b) \times 2^{-9} \\
=(4147) \times 2^{-9} \\
=8.1 \text{ V}
\]

**MFR_SUPERVISOR_PASSWORD (FCh)**

Type: Write Block  
Data Number in Bytes: N/A  
Data Format: ASCII  
Default Value: As product specification  
Units: N/A  
Reference: N/A  

**Definition:** The MFR_SUPERVISOR_PASSWORD command is to write password used for manufacturer to configure and calibrate model, also to enter rom mode.
